COMMENT ON THE NATIONAL ALLOCATION PLAN OF CARBON EMISSION LICENCES PROPOSAL

The Portuguese Government released yesterday its first proposal of the 2005-2007 National Allocation Plan for CO₂ emissions (PNALE), which will be subject to public consultation until the end of March. A final proposal will then be submitted to the European Commission s appreciation and subsequently ratified by the Portuguese Council of Ministers by the 1 of October 2004. Therefore, the figures in the current proposal are preliminary and subject to adjustments.

Yesterday's proposal foresees the attribution of 38,940,517 tonnes of free CO₂ emission licences per annum to the industry sectors included in the 2003/87/CE Directive. Without providing any details on the individual licences' allocation per thermal plant, this proposal gives the electricity sector 21,500,179 tonnes of CO₂ licences per year (already adjusted for the 1.012 factor, in order to account for marginal increases in capacity utilisation in the existing sites).

It is worth mentioning that the 38,940,517 tonnes/year of total licences, but not the 21,500,179 tonnes/year attributed to the electricity sector, include an amount of 1,874,489 tonnes/year to be allocated to new entrants (CO₂ emitting facilities, including new thermal power plants such as EDP's TER CCGT, that will start operating from October 2004).

The 4th of February 2004 joint proposal made by the main Portuguese electricity generators which suggested the attribution of 24 million tonnes of CO₂ licences per year between 2005 and 2007 is not directly comparable with yesterday's proposal made by the Government. The latter includes the islands (Azores and Madeira) emissions and excludes both the hydro volatility risk and the emissions from new power plants:

The PNALE considers 1 million tonnes of CO₂ licences per year attributable to electricity generators from the Azores and Madeira islands;

The PNALE assumes an average hydrological regime in the calculation of the licence attributions to the electricity sector, while the proposal made by the Portuguese electricity generators assumed a dryer hydrological regime for the 2005-2007 period. This difference amounts to approximately 2 million tonnes of CO₂ per year;

The PNALE set apart, in an item called *Reserva Novas Instalações*, the emission licenses from new combustion sites that will start operating between October 2004 and the end of 2007. These licenses should partly be attributed to the electricity sector, namely, to TER's second and third generation groups (EDP's new CCGT). Regarding the Portuguese electricity generators' proposal, emissions from new thermal power plants were included in the global licensing needs presented to the Government.

The non-consideration of a dry hydrological regime, as proposed by the Portuguese electricity generators, might result in the need of acquiring additional licenses, which would have an impact on the Portuguese electricity system's costs.

The current license attribution proposal already takes into consideration the Electricity sector plan to reduce CO₂ emissions by 4.7 million tonnes until 2010 as a result of the voluntary effort to be made by generators in the development of more

environmental-friendly energy sources. EDP's targets on this issue were announced to the market on the 2nd of December 2003 when it presented its Strategy 2006 plan.

The PNALE presented today considers a realistic view on the evolution of CO₂ emission that should not compromise the country's economic convergence towards the European Union average.

EDP ELECTRICIDADE DE PORTUGAL, S.A.

Preliminary proposal for license attribution 2005-2007

Activity	Emissions 2000	Emissions 2002	License 2005-2007	% vs. 2002
Energy				
Thermoelectric power plants	18,508,489	21,887,725	21,248,469	-2.9%
Refinery	2,549,542	2,888,988	3,032,404	5.0%
