

BARCLAYS PLC  
Form 6-K  
March 25, 2009

**UNITED STATES  
SECURITIES AND EXCHANGE COMMISSION  
Washington, DC 20549**

**FORM 6-K**

**REPORT OF FOREIGN PRIVATE ISSUER  
PURSUANT TO RULE 13A-16 OR 15D-16  
UNDER THE SECURITIES EXCHANGE ACT OF 1934**

March, 2009

**Barclays PLC and  
Barclays Bank PLC**  
(Names of Registrants)

**1 Churchill Place  
London E14 5HP  
England**  
(Address of Principal Executive Offices)

Indicate by check mark whether the registrant files or will file annual reports  
under cover of Form 20-F or Form 40-F.

Form 20-F  Form 40-F

Indicate by check mark whether the registrant by furnishing the information  
contained in this Form is also thereby furnishing the information to the  
Commission pursuant to Rule 12g3-2(b) under the Securities Exchange Act of 1934.

Yes  No

If "Yes" is marked, indicate below the file number assigned to the registrant  
in connection with Rule 12g3-2(b):

This Report is a joint Report on Form 6-K filed by Barclays PLC and Barclays  
Bank PLC. All of the issued ordinary share capital of Barclays Bank PLC is  
owned by Barclays PLC.

This Report comprises:

Edgar Filing: BARCLAYS PLC - Form 6-K

Information given to The London Stock Exchange and furnished pursuant to  
General Instruction B to the General Instructions to Form 6-K.

EXHIBIT INDEX

Consolidated Basel 2 Pillar 3 Disclosure 2008 - 24 March, 2009

---

**SIGNATURES**

Pursuant to the requirements of the Securities Exchange Act of 1934, each of the registrants has duly caused this report to be signed on its behalf by the undersigned, thereunto duly authorized.

**Table**

**number Contents**

**Overview**

1.0 Differences between the scope of statutory and regulatory consolidation

**Capital Resources**

2.0 Tier 1 and Tier 2 Capital Resources

**Capital Requirements**

3.0 Minimum capital requirement for credit risk under the Standardised approach

3.1 Minimum capital requirement for credit risk under the IRB approach

3.2 Minimum capital requirement for market risk and counterparty risk

3.3 Minimum capital requirement for operational risk

3.4 Minimum capital requirement and risk weighted assets

**Credit Risk**

4.0 Counterparty credit exposure

4.1 Notionals of credit derivative contracts

4.2 Counterparty credit exposure analysed by financial contract type

4.3 Notional value of credit derivative contracts held for hedging purposes

4.4 The scope of the Standardised and IRB Approaches

4.5 Credit risk exposure under the Standardised approach

4.6 Credit risk exposures under the Advanced and Foundation IRB approaches

4.7 Geographic analysis of credit risk exposures under the Standardised approach

4.8 Geographic analysis of credit risk exposures under the Foundation IRB approach

4.9 Geographic analysis of credit risk exposures under the Advanced IRB approach

4.10 Industry analysis of credit exposure under the Standardised approach

4.11 Industry analysis of credit exposure under the Foundation IRB approach

4.12 Industry analysis of credit exposure under the Advanced IRB approach

4.13 Residual maturity analysis credit exposures under the Standardised approach

4.14 Residual maturity analysis credit exposures under the Foundation IRB approach

4.15 Residual maturity analysis credit exposures under the Advanced IRB approach

4.16 Industry analysis of impaired and past due exposures and allowance for impairment

4.17 Geographic analysis of impaired and past due exposures and allowance for impairment

4.18 Analysis of movement on impairment and amounts taken directly to profit and loss

4.19 Credit rating agencies and credit quality steps under the Standardised approach

4.20 Credit quality steps and risk weights under the Standardised approach

4.21 Credit quality step analysis of pre CRM exposure and capital deductions under the Standardised approach

4.22 Credit quality step analysis of post CRM exposure and capital deductions under the Standardised approach

**Non Trading Book Information**

5.0 Risk weighted exposures of equity investments

5.1 Fair value of and gains and losses on equity investments

5.2 Sensitivity of the Banking Book to interest rate changes

**Securitisations**

- 6.0 Outstanding amount of exposures securitised
- 6.1 Analysis of impaired, past due and losses recognised on exposures securitised
- 6.2 Aggregate amount of securitised positions retained or purchased
- 6.3 Analysis of securitised positions retained or purchased by risk weight
- 6.4 Aggregate amount of securitised revolving exposures
- 6.5 Analysis of securitisation activity in 2008
- Credit Internal Ratings Based Approach**
- 7.0 Internal default grade probabilities
- 7.1 External ratings and financial statements description
- 7.2 Advanced IRB Wholesale Obligor Grade Disclosure
- 7.3 Analysis of exposures secured on real estate collateral by expected loss grade
- 7.4 Analysis of unsecured exposures by expected loss grade
- 7.5 Impairment and actual value charges
- 7.6 Analysis of expected loss versus actual losses
- 7.7 Analysis of expected credit model performance versus actual results
- Credit Risk Mitigation**
- 8.0 Collateral and guarantees for Standardised approach
- 8.1 Collateral and guarantees for Advanced and Foundation IRB approach

## 1.

### Overview

Barclays PLC (Barclays) operates under the Basel 2 capital adequacy framework. The framework consists of three pillars, each of which focuses on a different aspect of capital adequacy and stability.

Pillar 1 is a formal set of rules for calculating the minimum capital required by a firm to ensure that it has sufficient capital to cover potential losses arising from its business risks. The capital demand is based on a quantitative measure of the three main risks financial institutions face: credit risk, market risk and operational risk. Capital supply is the measure of the sources of capital available to a firm.

Pillar 2 complements Pillar 1 by focusing on a firm's internal capital adequacy process. Where necessary, this internal assessment will cover risks beyond the credit, market and operational risks identified within Pillar 1 to create a thorough assessment of the risks specific to that organisation. This assessment forms part of an ongoing dialogue with a firm's regulatory supervisor.

Pillar 3 is designed to be a public disclosure of a firm's risk and capital profile, building upon Pillar 1 and Pillar 2. The information disclosed is divided into qualitative information (about a bank's risk governance, risk methodologies and risk and capital management processes) and quantitative information (about its risk and capital). The quantitative disclosures provide data on the components of the calculation of risk and capital resources and requirements that form Pillar 1.

Barclays has included the qualitative disclosures required under Pillar 3 in its Annual Report. This Pillar 3 report contains the quantitative disclosures of Pillar 3.

Barclays lead regulator is the UK Financial Services Authority (FSA). The FSA has published its Pillar 3 regulations for firms within its "Prudential Sourcebook for Banks, Building Societies and Investment Firms" ("BIPRU" Section 11). Where the regulations specify the exact exposure classes, Barclays follows these explicit instructions. Where the regulations have not been explicit, such as in industry and geographic analyses, the Group (Barclays) has prepared them on the same basis as its Annual Report.

For the purposes of this document, credit exposure is defined as the maximum loss the Group estimates it might sustain in the event of a default or through the decline in value of an asset. This is not necessarily the same as the value of an asset in the Group's balance sheet as published in the Annual Report. Most significantly, balance sheet amounts only disclose drawn balances. Contractual commitments over undrawn balances are excluded from the balance sheet but are included in the calculation of exposure under Basel 2.

This document comprises eight chapters including this overview of the disclosure. The subsequent sections show:

### **Capital Resources**

A detailed breakdown of the components of the Group Tier 1 and Tier 2 capital resources.

### **Capital Requirements**

Further detail on how the various components of credit, market and operational risk are translated into capital requirements by Pillar 1 calculations. It extends the RWA disclosure provided historically within the Annual Report.

### **Credit Risk**

This section discloses the exposures Barclays measures as part of the calculation of its credit risk capital requirement. Barclays has regulatory approval to apply Advanced and Foundation Internal Ratings Based (IRB) approaches to calculate exposures over many portfolios. The Foundation IRB approach is only used for ABSA's wholesale portfolios. Barclays uses the Standardised approach for the remainder of its calculations. The Standardised approach rules use a very similar methodology to the Basel 1 framework with the addition of external credit ratings into the methodology. The section also contains information about exposures that are past due or impaired, and also the extent to which Barclays relies upon credit rating agencies in the determination of its Pillar 1 capital requirement.

### **Non Trading Book Information**

This section discloses information about the equities held by the Group outside of the trading book, and also the sensitivity of the entire Group portfolios to upward and downward shocks to interest rates.

### **Securitisations**

This section discloses information about Barclays securitisation activities distinguishing between the various roles Barclays plays in this business. It includes traditional securitisations as well as synthetic transactions effected through the use of derivatives.

### **Credit Internal Ratings Based Approach**

Barclays has regulatory approval to compute its credit capital requirement through the use of its internal credit risk models. This section provides detail of the performance of the models' estimates against actual outcomes and shows some of the intermediate steps in the calculations.

### **Credit Risk Mitigation**

This section discloses information about credit exposures which are reduced through the application of eligible financial collateral, credit derivatives and guarantees.

### **Basis of Preparation and Consolidation**

All of these disclosures are published for Barclays PLC on a consolidated basis for the year ended 31 December 2008. Where this document discloses credit exposures or capital requirements, Barclays has followed the scope and application of its Pillar 1 capital adequacy

calculations. Where figures for impairment or losses are disclosed within this document Barclays has followed the IFRS definitions used in the Barclays Annual Report. Barclays intends to make Pillar 3 disclosures annually but will review the need for more frequent disclosure in the light of market and business conditions. As this is the first year that Barclays is publishing Pillar 3 data Barclays has not provided comparative data, as in 2007 Barclays was still operating under the Basel 1 regime. The consolidation basis used is the same as that used for regulatory capital adequacy. Certain overseas subsidiaries operate under local regulatory capital regimes which are recognised as equivalent by the FSA. In these cases Barclays has used these local capital calculations in its group consolidation. The scope of consolidation is similar to that used for statutory accounting reporting for most of the Group's activities. The following differences do occur between regulatory consolidation and IFRS consolidation;

**Table 1.0: Differences between the scope of statutory and regulatory consolidation.**

| <b>Entity</b>   | <b>Statutory accounting treatment</b> | <b>Basel 2 Regulatory treatment</b>   |
|---|---------------------------------------|---|
| Subsidiaries engaged in non-financial activities such as insurance                            | Fully consolidated                    | An investment in an unconsolidated subsidiary deducted from capital as a material holding |
| Associates, joint ventures and participations in businesses which are financial in nature     | Accounted for on an equity basis      | Consolidated in proportion to the participation.  |
| Associates, joint ventures and participations in businesses which are not financial in nature | Accounted for on an equity basis      | Deducted from capital as a material holding   |
| Private equity investments treated as associates  | Accounted for on an equity basis      | The underlying investments are individually risk weighted.                                |

Pillar 3 disclosures are at consolidated group level. However, Barclays has a number of subsidiary companies which are also FSA approved firms. The regulations require any such subsidiaries which are significant to disclose limited Pillar 3 information. Barclays has a significant subsidiary in the Absa Bank Limited. Absa Group's primary regulator is the South African Reserve Bank (SARB). Absa has disclosed complete Pillar 3 information in compliance with the SARB's regulations. These disclosures may be found in the Investor Relations section of Absa's website:

[www.Absa.co.za](http://www.Absa.co.za)

H

### **Capital Deficiencies**

Barclays had no subsidiaries outside the scope of regulatory consolidation which had capital resources less than their required minimum at 31 December 2008.

2 .

### **Capital Resources**

The following table represents the Group's capital position at 31 December 2008.

**Table 2.0: Tier 1 and Tier 2 Capital Resources**

|   | <b>As at</b>    |
|---|-----------------|
|   | <b>31.12.08</b> |
|   | £m              |
| <b>Tier 1 (excluding innovative tier 1)</b>   |                 |
| Called up share capital   | 2,093           |
| Eligible reserves   | 31,156          |
| Minority interests  | 8,172           |
| Tier 1 Notes  | 1,086           |
| Less: Intangible assets   | (9,964)         |
| Less: Deductions from Tier 1 capital - Expected loss in excess of impairment on IRB approach portfolios | (159)           |
| Less: Deductions from Tier 1 capital - Other  | (877)           |
| <b>Total qualifying tier 1 capital (excluding innovative tier 1)</b>                                    | <b>31,507</b>   |
| <b>Innovative Tier 1 One Capital</b>  | <b>7,087</b>    |
| <b>Tier 2</b>   |                 |
| Revaluation reserves  | 26              |
| Available for sale equity gains   | 122             |
| Collectively assessed impairment allowances   | 1,654           |
| Minority interests  | 607             |
| Qualifying subordinated liabilities   |                 |
| Undated loan capital  | 5,401           |
| Dated loan capital  | 14,215          |
| <b>Total innovative tier 1 capital and tier 2 capital</b>   | <b>29,112</b>   |
| Less: Deductions from Tier 2 capital - Expected loss in excess of impairment on IRB approach portfolios | (159)           |
| Less: Deductions from Tier 2 capital - Other  | (877)           |
| <b>Total innovative tier 1 capital and tier 2 capital after deductions</b>                              | <b>28,076</b>   |
| Less: Regulatory deductions from the total of tier 1 and tier 2 capital                                 |                 |
| Investments not consolidated for supervisory purposes   | (403)           |
| Other deductions  | (453)           |
| Total deductions from the total of tier 1 and tier 2 capital  | (856)           |
| <b>Total net capital resources</b>  | <b>58,727</b>   |

The Capital Requirements Directive requires Tier 1 capital to be calculated excluding innovative capital. This is the basis on which we have disclosed the Group's Tier 1 capital above. The FSA's capital requirements permit the inclusion of innovative Tier 1 capital subject to a limit of 15% of the total Tier 1 capital. Innovative capital in excess of the 15% limit can be included in Tier 2 capital.

### 3. Capital Requirements

The following table represents the Group's credit risk capital requirement for exposures measured under the Standardised approach method. More details on the calculation of exposure and risk weighting under the Standardised approach may be found in the Credit Risk section of this document.

**Table 3.0: Minimum capital requirements for credit risk under the Standardised approach**

|   | <b>Minimum Capital</b> |
|---|------------------------|
|   | <b>As at 31.12.08</b>  |
| <b>Standardised Approach Credit Risk Exposure Class</b> | £m                     |
| Central governments or central banks                    | 129                    |
| Regional government or local authorities                | 1                      |
| Administrative bodies and non-commercial undertakings   | 5                      |
| Multilateral development banks                          | -                      |
| International organisations                             | -                      |
| Institutions  | 80                     |
| Corporates  | 3,837                  |
| Retail  | 1,791                  |
| Secured on real estate property                         | 1,367                  |
| Past due items  | 295                    |
| Private equity  | 635                    |
| <b>1</b>  |                        |
| Covered bonds   | -                      |
| Securitisation positions                                | -                      |
| <b>2</b>  |                        |
| Short term claims on institutions and corporates        | 538                    |
| Collective investment undertakings                      | 48                     |
| Other items   | 151                    |
| <b>Total Standardised Approach Requirement</b>          | <b>8,877</b>           |

**1**

A strict interpretation of the regulations would require the Group to describe its private equity positions as "Items belonging to regulatory high risk categories". Barclays believes it is more useful to provide an objective description of these assets and their exposures and capital requirements within these disclosures.

**2**

Securitisation positions under the Standardised approach are treated as capital deductions and are therefore not included in the table above.

The Internal Ratings Based (IRB) approach allows firms to compute their regulatory capital requirement through the use of their own proprietary credit models. These models generate the inputs - Probability of Default (PD), Loss Given Default (LGD) and Exposure at Default (EAD) - required to populate the AIRB regulatory capital calculation. As well as meeting the minimum requirements for IRB models laid down by regulators, banks are required to prove the appropriateness of IRB metrics by using them for a variety of business-as-usual purposes such as credit approval, limit setting and internal capital allocation. This is known as the "Use Test".

The models are then recalibrated to operate with assumptions set by regulators which simulate downturn conditions including increased correlations between assets. Finally, the models' operating parameters are adjusted to capture an unexpected loss.

**Table 3.1: Minimum capital requirement for credit risk under the IRB approach**

| <b>Minimum<br/>Capital<br/>As at 31.12.08</b> |               |
|---|---------------|
| <b>IRB Approach Exposure Class</b>            | <b>£m</b>     |
| Central governments or central banks          | 44            |
| Institutions                                  | 692           |
| Corporates                                    | 5,671         |
| Retail  |               |
| -   |               |
| Small and medium enterprises (SME)            | 689           |
| - Secured by real estate collateral           | 1,238         |
| - Qualifying revolving retail                 | 813           |
| - Other retail                                | 835           |
| Equity - Simple Risk Weight Approach          |               |
| - Exchange traded exposures                   | 48            |
| - Private equity exposures                    | 171           |
| - Other exposures                             | -             |
| Securitisation positions                      | 1,273         |
| Non-credit obligation assets                  | 1,001         |
| <b>Total IRB Approach Requirement</b>         | <b>12,475</b> |

In addition to the securitisation positions above there are also Advanced approach positions which are treated as deductions from capital and included within Table 2.0.

**Market Risk and Counterparty Credit Risk**

The following table represents Barclays market risk capital requirements, which comprise three elements;

1)

Trading book positions where the market risk is measured under an FSA approved Daily Value at Risk (DVaR) model. A detailed description of the DVaR model and its controls may be found on page 120 of Barclays 2008 Annual Report.

2)

Trading book positions within overseas subsidiaries which operate under the capital requirements of their local regulators and are recognised as equivalent regimes by the FSA. In such cases the FSA requires that the local capital requirement is aggregated with the Group total.

3)

Trading book positions which have not yet met the conditions for inclusion within the approved DVaR model. Their capital requirement is calculated using Standardised rules.

**Table 3.2: Minimum capital requirement for market risk and counterparty risk**

|   | <b>Minimum Capital</b> |
|---|------------------------|
|   | <b>As at 31.12.08</b>  |
| <b>Market Risk</b>                                  | £m                     |
| DVaR Model Based PRR                                | 1,778                  |
| Interest rate PRR                                   | 1,790                  |
| <sup>1</sup> Equity PRR                             | 84                     |
| Option PRR  | 2                      |
| Collective investment schemes PRR                   | 162                    |
| Commodity PRR                                       | 75                     |
| Foreign exchange PRR                                | 1                      |
| Local Regulatory Aggregated PRR                     | 1,338                  |
| <b>Total Market Risk Capital Requirement</b>        | <b>5,230</b>           |
| Concentration risk capital requirement              | -                      |
| <b>Counterparty credit risk capital requirement</b> | <b>5,672</b>           |

<sup>1</sup> PRR, Position Risk Requirement

**Operational Risk**

The following table shows the Group's operational risk capital requirement. Barclays has approval from the FSA to calculate its operational risk capital requirement using a Basel 2 Advanced Measurement Approach (AMA). Recently acquired businesses are excluded from the approval. Barclays uses the Basic Indicator Approach or the Standardised approach while it transitions these areas to the Advanced Measurement Approach. More information about Barclays operational risk modelling may be found on page 131 of Barclays 2008 Annual Report.

**Table 3.3: Minimum capital requirement for operational risk**

|   | <b>Minimum Capital</b> |
|---|------------------------|
|   | <b>As at 31.12.08</b>  |
| <b>Operational Risk</b>                     | £m                     |
| Operational Risk - Basic Indicator Approach | 125                    |
| Operational Risk - Standardised Approach    | 22                     |

### **Minimum Capital Requirements and Risk Weighted Assets (RWA) analysis**

Capital requirements may be converted into RWAs by multiplying them by 12.5. The following table shows a breakdown of the Group's RWAs by risk type.

**Table 3.4: Minimum capital requirement and risk weighted assets**

| <b>Risk Type</b>                                 | <b>Capital Requirement</b> | <b>RWA</b>            |
|--|----------------------------|-----------------------|
|  | <b>as at 31.12.08</b>      | <b>as at 31.12.08</b> |
|  | £m                         | £m                    |
| Standardised Approach Credit Risk                | 8,877                      | 110,975               |
| Advanced and Foundation IRB Approach Credit Risk | 12,475                     | 155,937               |
| Counterparty Credit Risk                         | 5,672                      | 70,902                |
| Total Credit Risk                                | 27,024                     | 337,814               |

## **4. Credit Risk**

### **Counterparty Credit Exposures**

Counterparty credit exposure arises from the risk that parties are unable to meet their payment obligations under financial contracts including derivatives, securities financing transactions, such as repurchase agreements, reverse repurchase agreements and stock borrow loan transactions, and also long settlement transactions. At 31 December 2008 Barclays had posted collateral of £63,232 million to cover its liabilities over derivative contracts in line with general market practice. Barclays Bank PLC's long term debt was rated AA- by Standard and Poors and Aa2 by Moodys as at 31 December 2008. In the event that these ratings were downgraded one increment the Group would be required to provide

a further £2,115 million and £267 million in collateral respectively. On 1 February 2009 Moodys downgraded Barclays Bank PLC to Aa3.

The following table shows Barclays counterparty credit exposure including the impact of netting contracts and the offset of collateral held. Where the Group calculates the exposure under the Standardised approach and the Internal Model Method the impact of both netting and collateral is integral to the calculation of the exposure. These contract exposures are therefore only available on a net basis. Where the Group uses the mark to market approach it is possible to identify the impact of netting and collateral.

**Table 4.0: Counterparty credit exposure**

|                       | <b>Gross Positive Fair Value of Contracts</b> | <b>Potential Future Credit Exposure</b> | <b>Netting Benefits</b> | <b>Netted Current Credit Exposure</b> | <b>Collateral Held</b> | <b>Net Derivatives Credit Exposure</b> |
|-----------------------|---|---|-------------------------|---------------------------------------|------------------------|--|
| <b>As at 31.12.08</b> | £m  | £m                                      | £m                      | £m                                    | £m                     | £m                                     |
| Mark to Market Method | 32,872  | 26,279                                  | (39,258)                | 19,893                                | -                      | 19,893                                 |
| Standardised Approach | N/a   | N/a                                     | N/a                     | N/a                                   | N/a                    | 2,122                                  |
| Internal Model Method | N/a   | N/a                                     | N/a                     | N/a                                   | N/a                    | 108,130                                |
| <b>Total</b>          | <b>N/a</b>                                    | <b>N/a</b>                              | <b>N/a</b>              | <b>N/a</b>                            | <b>N/a</b>             | <b>130,145</b>                         |

In line with industry practice Barclays normally deducts collateral received from the loss given default or risk weight rather than from the exposure in calculating the expected loss.

**Credit Derivative Notionals**

The following table shows the notional of the credit derivative transactions purchased and sold by the Group during 2008.

**Table 4.1: Notionals of credit derivative contracts**

| <b>Credit Derivative Product Type as at 31.12.08</b> | <b>Notional Credit Derivative Transactions</b> |               |                                  |                  |
|--|--|---------------|----------------------------------|------------------|
|  | <b>Own Credit Portfolio</b>                    |               | <b>Intermediation Activities</b> |                  |
|  | <b>Purchased</b>                               | <b>Sold</b>   | <b>Purchased</b>                 | <b>Sold</b>      |
|  | £m   | £m            | £m                               | £m               |
| Credit Default Swaps                                 | 16,516   | 13,120        | 1,490,211                        | 1,410,249        |
| Total Return Swaps                                   | -  | -             | 42,902                           | 2,820            |
| <b>Total</b>   | <b>16,516</b>                                  | <b>13,120</b> | <b>1,533,113</b>                 | <b>1,413,069</b> |

Barclays internal counterparty credit risk models calculate expected exposure as the first stage in the preparation of the regulatory capital requirement. The model is calibrated to simulate an economic downturn through the use of a scaling factor (known generically as

alpha) to arrive at the exposure at default. Barclays models have set this factor at 1.4.

### Current Counterparty Credit Exposure

The following table shows the Group's exposure at default (EAD) to counterparty credit risk after credit risk mitigation (CRM) analysed by the type of financial contract.

**Table 4.2: Counterparty credit exposure analysed by financial contract type**

| Financial Contract Type                         | As at 31.12.08                           |  | EAD Post CRM under Internal Model Method |
|---|--|--|--|
|   | EAD Post CRM under Standardised Approach | EAD Post CRM under Mark to Market Approach |  |
|   | £m                                       | £m   | £m                                       |
| Interest Rate Contracts                         | -  | 1,485                                      | N/A                                      |
| Foreign Currency Contracts                      | -  | 1,741                                      | N/A                                      |
| Gold Contracts                                  | -  | 224  | N/A                                      |
| Equities Contracts                              | -  | 1,277                                      | N/A                                      |
| Precious Metal other than Gold Contracts        | -  | -  | N/A                                      |
| Commodities other than Precious Metal Contracts | -  | 14,090                                     | N/A                                      |
| Securities financing transactions               | 4,171                                    | 3,672                                      | N/A                                      |
| Credit Derivatives                              | -  | 208  | N/A                                      |
| Other   | 2,122                                    | 868  | N/A                                      |
| <b>Total</b>                                    | <b>6,293</b>                             | <b>23,565</b>                              | <b>157,542</b>                           |

The nature of the calculation of credit exposure under the internal model method precludes the identification of individual product exposures. Only a total for each counterparty is calculated.

### Risk Methodology

The following table sets out the notional value of the Group credit derivative contracts held for hedging purposes.

**Table 4.3: Notional value of credit derivative contracts held for hedging purposes**

|   | As at 31.12.08 |
|---|----------------|
| Risk Methodology  | £m             |
| Notional value of credit derivative hedges under the Standardised Approach Method | -              |
| Notional value of credit derivative hedges under the Mark to Market Method        | -              |
| Notional value of credit derivative hedges under the Internal Model Method        | 5,047          |
| <b>Total</b>  | <b>5,047</b>   |

The following table summarises the principal portfolios within Barclays that use the Standardised, Foundation IRB and Advanced IRB approaches:

**Table 4.4: The scope of the Standardised and IRB Approaches**

| <b>Business</b>                                       | <b>Standardised Approach</b>  | <b>Foundation IRB Approach</b> | <b>Advanced IRB Approach</b>          |

| <b>Total Standardised Approach Credit Risk Exposure</b> | <b>152,504</b>        | <b>132,979</b>                           |

### **Advanced and Foundation IRB Approach Credit Exposure**

The following table shows the Group's credit exposures measured under the Advanced Internal Ratings Based approach and the Foundation Internal Ratings Based approach before the application of credit risk mitigation. The Advanced IRB approach uses proprietary estimates of probability of default (PD), loss given default (LGD) and conversion factor to model the exposure while the Foundation IRB approach uses proprietary PD and regulatory standard parameters for LGD and conversion factor. The Foundation IRB approach may only be used for wholesale credit exposures and is not applicable to retail, equity, securitisation position and non-credit obligation asset exposures.

**Table 4.6: Credit risk exposures under the Advanced and Foundation IRB approaches**

The securitisation positions above include all of the securitisations detailed in section 6 below and also certain securitisations which follow the treatment of the asset securitised when calculating the capital requirement

This document discloses exposures and capital requirements for Barclays assets. Generally a particular asset will be disclosed within the same category when showing its exposure or its capital requirement. However, within the above exposure table are assets which are the underlyings for synthetic securitisations. The asset exposure disclosed is that of the underlying asset. However, as they are part of a securitisation their capital requirement is calculated and disclosed as a securitisation position in those tables which show Barclays capital requirements.

### Geographic Analysis

The following tables represent Barclays credit exposure by geographic region. Exposures are allocated to the region in which the customer is located and are disclosed before the application of credit risk mitigation.

**Table 4.7: Geographic analysis of credit risk exposures under the Standardised approach**

### Industry Analysis under Standardised Approach

The following table represents the Group's credit exposures split by industry and counterparty type. Exposure includes drawn as well as undrawn amounts and is Barclays calculation of the expected maximum amount which may be drawn at the time of default. It cannot be directly compared to the balance sheet industry analysis contained within the Barclays Annual Report. However, Barclays has used the same industry classification of its customers in this document and the Annual Report.

**Residual maturity analysis**

The maturity analysis below discloses all of the Group's credit exposure by contractual maturity date. This is the basis upon which capital adequacy calculations are performed. This differs from the treatment required by IFRS, under which firms disclose drawn balances rather than exposures and apportion maturity according to their repayment schedule.

**Table 4.13: Residual maturity analysis credit exposures under the Standardised approach**

| Direct recoveries             | -                     |

**Credit rating agencies**

Under the Standardised approach the Group makes limited use of credit ratings assigned by credit rating agencies in its calculation of credit risk weighted assets. The FSA determines which agencies may be relied upon in the determination of this risk weight.

Barclays uses ratings assigned by the following agencies:

Standard & Poors

Moody's

Fitch

These ratings are used in the calculation of the following exposure classes:

Central governments and central banks

Institutions

Corporates

Short term claims on institutions and corporates

**Unrated and Rated Counterparties**

Where a rating is not available Barclays follows the provisions of the regulations that cover this state. The following is a summary of the rules governing the Standardised approach. Each exposure must be assigned to one of six credit quality steps if a rating is available as defined in the table below

**Table 4.19: Credit rating agencies and credit quality steps under the Standardised approach**

|                                  |                       |                     |  |
|----------------------------------|-----------------------|---------------------|--|
| Standard and Poors<br>AAA to AA- | Moody's<br>Aaa to Aa3 | Fitch<br>AAA to AA- | Credit Quality Step<br>Credit Quality Step 1 |
| A+ to A-                         | A1 to A3              | A+ to A-            | Credit Quality Step 2                        |
| BBB+ to BBB-                     | Baa1 to Baa3          | BBB+ to BBB-        | Credit Quality Step 3                        |
| BB+ to BB-                       | Ba1 to Ba3            | BB+ to BB-          | Credit Quality Step 4                        |
| B+ to B-                         | B1 to B3              | B+ to B-            | Credit Quality Step 5                        |
| CCC+ and below                   | Caa1 and below        | CCC+ and below      | Credit Quality Step 6                        |

The credit quality step, exposure class and maturity are then used to determine the risk weight percentage. Exposures cannot be assigned a risk weight that is lower to that of the sovereign risk of the country in which the asset is located. Where a rating is not available in most cases the treatment is approximately equivalent to that which is applied to credit quality step 3. The following table is a simplified version of the risk weight allocation process.

**Table 4.20: Credit quality steps and risk weights under the Standardised approach**

| Credit quality Step   | Central governments and central banks | Corporates | Institutions greater than 3 months maturity |
|-----------------------|---------------------------------------|------------|---|
| Credit quality Step 1 | 0%                                    | 20%        | 20%   |
| Credit quality Step 2 | 20%                                   | 50%        | 50%   |
| Credit quality Step 3 | 50%                                   | 100%       | 50%   |
| Credit quality Step 4 | 100%                                  | 100%       | 100%  |
| Credit quality Step 5 | 100%                                  | 150%       | 100%  |
| Credit quality Step 6 | 150%                                  | 150%       | 150%  |

Retail exposures are generally assigned a risk weight of 75%. More detailed criteria are applied for exposures secured on residential or commercial property to include the credit risk mitigation

### Credit Quality Assessment Scale

The following table shows the exposures calculated under the Standardised approach broken down by credit quality step as specified by the Standardised approach rules (further detail on this may be obtained from the FSA's BIPRU regulations, Section 3).

**Table 4.21: Credit quality step analysis of pre CRM exposure and capital deductions under the Standardised approach**

5.

**Non Trading Book Information****Equity Investments**

Within these disclosures the Group has adopted a definition of equity that is consistent with the IFRS definition used within the Annual Report. Barclays reports non trading book equities under the Advanced IRB approach and the Standardised approach. (The Advanced IRB approach is only available where regulatory approval has been given.) The following table shows the Group's exposure to equities where it uses the Simple Risk Weight approach under the Advanced IRB approach to determine the credit exposure;

**Table 5.0: Risk weighted exposures of equity investments**

**Risk Weighted Exposure Amount for Equities  
Exposures using Simple Risk Weight Approach**

| <b>Risk Weight Category</b>                                 | <b>As at 31.12.08</b> |
|---|-----------------------|
|   | £m                    |
| Exchange Traded Equity                                      | 602                   |
| Private Equity  | 2,133                 |
| Other equity  | -                     |
| <b>Total Risk Weighted Exposure<br/>Amount for Equities</b> | <b>2,735</b>          |

Barclays also has non trading book equity investments which are risk weighted under the Standardised approach.

The following table shows the Group exposure to equities not held in the trading book. All equities are held at fair value. Page 290 of Barclays 2008 Annual Report provides more information on the methodologies Barclays follows in the determination of fair value. The market price is deemed to be the fair value for exchange traded equities.

### **Interest Rate Risk Sensitivity**

The following table shows the Group's sensitivity to 200 basis point shock to interest rates across all maturities for positions outside of its trading book. Where current interest rates are lower than 2% the analysis has calculated the sensitivity to rates that are negative. Whilst such conditions are extremely rare they are not unknown and this interpretation is in line with regulatory guidance.

#### **Table 5.2: Sensitivity of the Banking Book to interest rate changes**

| <b>Currency</b> | <b>Change in Economic Value of<br/>Equity<br/>£m</b> |                           |
|-----------------|--|---------------------------|
|                 | <b>As at 31.12.08<br/>+ 200 basis points</b>         | <b>- 200 basis points</b> |
| GBP             | (1,373)  | 1,509                     |
| USD             | (324)  | 269                       |
| Euro            | (323)  | 380                       |

|   |                |              |
|---|----------------|--------------|
| Rand  | (136)          | 143          |
| Other   | (92)           | 24           |
| <b>Total Economic Value of Equity (EVE)</b>           | <b>(2,248)</b> | <b>2,325</b> |
| <b>Percentage of EVE to Tier 1 and Tier 2 Capital</b> | <b>-3.77%</b>  | <b>3.90%</b> |

A basis point is 1/100 of 1%.

Economic Value of Equity (EVE) quantifies the change in value of the balance sheet for a 200bp interest rate shock. Balance sheet growth will necessarily increase the level of EVE. Comparison of this metric to Barclays total Tier 1 and Tier 2 capital provides a number that is independent of the size of the balance sheet and therefore better represents the potential impact on shareholder value.

## 6. Securitisations

Barclays arranges securitisations in two principal capacities, according to the definitions set out in FSA regulations: as originator where it has directly, or through related entities, been involved in the original agreement which created the exposures securitised or if it purchases third party exposures and securitises them, and as sponsor for its asset backed commercial paper (ABCP) conduit programmes. Within the securitisation market it is possible that asset backed notes created by a previous securitisation are subsequently re-securitised. Barclays activity in these structures is separately analysed below.

The securitisations disclosed below are those position whose capital requirement has been calculated by reference to securitisation framework under FSA regulations. The amounts reported are typically higher than those shown in the Annual Report as disclosure guidance requires all underlying exposures to be shown where a securitisation position has been created during the year regardless of any accounting de-recognition treatment. De-recognition in subsequent years is only permitted if the entire exposure has been moved to another party.

**Table 6.0: Outstanding amount of exposures securitised**

| Exposure Type               | Outstanding Amount of Exposures Securitised |         |                        |         |
|-----------------------------|---|---------|------------------------|---------|
|                             | Traditional Transactions                    |         | Synthetic Transactions |         |

**Credit Internal Ratings Based Approach****Advanced IRB Wholesale Obligor Grade Disclosures**

Barclays has regulatory approval to use its internal credit models in the calculation of the majority of its credit risk and counterparty credit risk (OTC derivatives, repurchase, and reverse repurchase and stock borrow loan transactions) exposures.

**Calculation of internal ratings**

To calculate probability of default (PD), Barclays assesses the credit quality of borrowers and other counterparties and assigns them an internal risk rating. Multiple rating methodologies may be used to inform the rating decision on individual large credits, such as internal and external models, rating agency ratings, and for wholesale assets market information such as credit spreads. For smaller credits, a single source may suffice such as the result from an internal rating model. For retail clients PD models use application and behavioural scorecards which are derived from historically observed performance of new clients.

They are built utilising customer demographic and financial information, supplemented by credit bureau information where available. Through statistical techniques the relationship between these candidate variables and the default marker is quantified to produce output scores reflecting a PD.

Barclays internal credit grading differentiates credit risk into 21 grades as well as a category of "in default".

**Table 7.0: Internal Default Grade Probabilities**

Satisfactory  
Weak / Substandard

Exposure at default (EAD) represents the expected level of usage of the credit facility when default occurs. At default the customer may not have drawn the loan fully or may already have repaid some of the principal, so that exposure is typically less than the approved loan limit. When the Group evaluates loans, it takes exposure at default into consideration, using its extensive historical experience. It recognises that customers may make heavier than average usage of their facilities as they approach default. The lower bound of EAD is the actual outstanding balance at calculation of EAD. For derivative instruments, exposure in the event of default is the estimated cost of replacing contracts with a positive value should counterparties fail to perform their obligations. When a customer defaults, some part of the amount outstanding on their loans is usually recovered. The part that is not recovered, the actual loss, together with the economic costs associated with the recovery process comprise the loss given default (LGD) figure, which is expressed as a percentage of EAD. Using historical information, the Group estimates how much is likely to be lost, on average, for various types of loans in the event of default. The level of LGD depends principally on: the type of collateral; the seniority or subordination of the exposure; the industry in which the customer operates (if a business); the length of time taken for the recovery process and the timing of all associated cash flows; and the jurisdiction applicable and work-out expenses. The outcome is also dependent on economic conditions that may determine, for example, the prices that can be realised for assets, whether a business can readily be refinanced or the availability of a repayment source for personal customers.

Expected loss amount is the product of PD, exposure value and LGD. For defaulted assets where the PD is 1.0 the expected loss is Barclays best estimate of the expected loss for the defaulted exposure.

The following table shows the Group's exposure for Advanced IRB approach and Foundation IRB approach portfolios in its wholesale business in both the Trading and Banking books;

**Table 7.2: Advanced IRB Wholesale Obligor Grade Disclosures**

| EL Grade => 2.15 - < 4.45%  |   | 1,103          |
| EL Grade => 4.45 - < 8.65%  |   | 477            |
| EL Grade => 8.65 - < 18.65% |   | 1,391          |
| EL Grade => 18.65 - < 100%  |   | 94             |
| <b>Total</b>                |   | <b>106,954</b> |

The impact of real estate security on the expected loss is significant. These assets have much lower LGDs as are shown in our credit model performance disclosure in Table 7.7.

Accordingly Barclays has expanded the EL grade disclosure for secured exposures to show more detail at the lower EL grades.

The following table shows the Group EAD for unsecured exposures.

**Table 7.4 Analysis of unsecured exposures by expected loss grade**

| <b>EL Grade</b>             | <b>EAD Post CRM</b> |                                    |                     | <b>Total Unsecured Retail</b> |
|-----------------------------|---------------------|------------------------------------|---------------------|-------------------------------|
|                             | <b>Retail SME</b>   | <b>Qualifying revolving retail</b> | <b>Other retail</b> |                               |

### **Impairment and Actual Value Charges**

The following table shows the impairment and actual value adjustments taken by the Group in the portfolios to which the IRB approaches apply. The figures include actual value adjustments taken on portfolios within the trading book and banking book where the Advanced IRB approach is used to determine the counterparty credit exposure. These charges are included within the net trading income and net investment income within

Barclays Annual Report. This is one reason why the figures below are different from the Impairment roll-forward analysis in Table 4.18. Additionally, the figures below are only for portfolios which use the IRB approaches; in contrast the analysis in Table 4.18 shows impairment and actual value charges for both IRB and Standardised approach portfolios.

Whilst the figures below are higher than charges experienced in recent years Barclays believes they are consistent with past experience of impairment during more challenging economic conditions. Rates of default have risen but at this time the loss given default levels have remained stable.

**Table 7.5: Impairment and actual value charges**

|  | <b>Actual Value Adjustments and Individual<br/>Impairment Charges</b> |
|--|---|

| <b>Total</b>   | <b>2,301</b>  |

**Loss Analysis - Regulatory Expected Loss versus Actual Losses**

The following table shows Barclays Regulatory Expected Loss measure compared to an actual loss measure in 2008 for those portfolios where credit risk is calculated using the Internal Ratings Based approach.

The excess of cumulative Actual Loss to 31 December 2008 over the Regulatory Expected Loss calculated at the start of 2008 is consistent with the credit market deterioration experienced in 2008.

**Regulatory Expected Loss**

Regulatory Expected Loss is a Basel 2 measure based upon Pillar 1 metrics which is an input to the Capital Adequacy process. Regulatory Expected Loss can be taken as a view of underlying credit quality and expectation of average future loss as derived from our IRB models, and is not a prediction of future impairment.

For non-defaulted assets, Regulatory Expected Loss is calculated using probability of default<sup>1</sup> and downturn loss given default estimates. For the calculation of Regulatory Expected Loss for defaulted assets, the probability of default is 100% and loss given default is based upon an estimate of likely recovery levels for each asset.

### Actual Loss

Cumulative Actual Loss is made up of two parts: the existing impairment stock at 31 December 2007 plus the net impairment charge recorded through the income statement in 2008.

Cumulative Actual Loss includes a degree of impairment allowance on assets not identified as being in default at the balance sheet date and can also include charges against assets that were originated during the year and which were therefore outside of the scope of the Regulatory Expected Loss calculated at the beginning of the year. Actual Loss does not include the effects on impairment stock of amounts written off in the year.

### Table 7.6 Analysis of expected loss versus actual losses

|                                      | Cumulative Total             |                            |
|--------------------------------------|------------------------------|----------------------------|
|                                      | Expected Loss<br>to 31.12.08 | Actual Loss<br>to 31.12.08 |
|                                      | £m                           | £m                         |
| <b>IRB Exposure Class</b>            |                              |                            |
| Central governments or central banks | 2                            | 2                          |
| Institutions                         | 168                          | 987                        |
| Corporates                           | 881                          | 1,609                      |
| <b>Retail</b>                        |                              |                            |

| - Secured by real estate collateral  | 304                          | 298                        |
| - Qualifying revolving retail        | 1,117                        | 1,503                      |
| - Other retail                       | 1,033                        | 1,351                      |
| Equity                               | 4                            | -                          |
| Securitisation positions             | -                            | -                          |
| Non-credit obligation assets         | N/A                          | -                          |
| <b>Total IRB</b>                     | <b>3,908</b>                 | <b>6,096</b>               |

<sup>1</sup> Probability of default estimates can be calculated on a through-the-cycle (TTC) basis, reflecting the predicted default frequency in an average 12 month period across the credit cycle, or on a point-in-time (PIT) basis, reflecting the predicted default frequency in the next 12 months

### Credit Model Performance - Estimated versus Actual

The following table shows the forecast and actual probability of default, loss given default and exposure at default ratio for the assets under the IRB approach. In each case the forecasts are based on Barclays operational model calibrations at the start of the period. This may differ from the models' applications in regulatory capital calculations where the probability of default is generally estimated on a "through the cycle" basis and the loss given default on a downturn basis. Additionally regulatory capital calculations set minimum values for certain parameters which are typically more conservative than Barclays modelled and observed values. In particular retail loans secured by real estate collateral have a regulatory minimum LGD of 10%.

**Table 7.7: Analysis of expected credit model performance versus actual results**

| IRB Exposure Class                   | PD                 |        | LGD                              |        | Exposure at Default                   |

| Secured by real estate collateral    |                    |        |                                  |        |                                       |
| South Africa <sup>3</sup>            | 5.03%              | 4.04%  | 7.70%                            | 5.50%  | 0.87                                  |
| Qualifying revolving retail          | 2.33%              | 2.30%  | 87.26%                           | 87.40% | 1.04                                  |
| Other retail                         | 6.20%              | 5.51%  | 70.93%                           | 75.13% | 1.01                                  |

The PDs above are based on the total portfolio of Advanced and Foundation assets managed by the Group. Individual portfolio PDs within an exposure class have been weighted in proportion to the expected monetary loss of the portfolio to arrive at the class PD. The LGD percentages and EAD ratios are based on analysis of defaulted assets only, under the Advanced approach (the Foundation approach does not estimate these figures but uses parameters stipulated by FSA regulations).

Where default rates are typically low Barclays carries out multi-year analysis to improve the sample data and as such the estimates and outcomes above do not represent the results for a single year. The LGD results for different portfolios have been weighted in proportion to the expected EAD of the defaulted assets. Where individual portfolio EAD results are based on multi-year analysis they have been annualised for consolidation by dividing them by the period of years the sample portfolio covers. Barclays does not use PD, EAD, LGD and expected loss models to calculate the credit risk of its equity, securitisation, non-credit obligation asset portfolios. Accordingly there is no model analysis to disclose for these exposure classes.

2

FSA regulations require the disclosure of appropriate components of the credit models' expected loss such as PD, LGD and Conversion Factor. The Conversion factor is the models' estimation of the utilisation of undrawn commitments at the time of default. Barclays believes that it is more useful and appropriate to disclose the ratio of the pre default estimated EAD to the actual EAD of defaulted assets at the time of default. Where the estimate exceeds the actual exposure the ratio is greater than 1.

3

Barclays has shown the model performance information for UK and South African retail exposures secured on real estate collateral separately because the total portfolio does not give homogeneous results.

8

### **Credit Risk Mitigation Collateral and Guarantees**

The following table shows the Group's exposure for assets in standardised approach portfolios after eligible collateral and guarantees.

**Table 8.0: Collateral and Guarantees for Standardised Approach**

| <b>Standardised Approach Credit<br/>Risk Exposure Class<br/>As at 31.12.08</b> | <b>Total Exposure after netting and volatility<br/>adjustments covered by Eligible Financial Collateral</b> | <b>£m</b>  |
|--|---|------------|
| Central governments or central banks   |   | -          |
| Regional government or local authorities                                       |   | -          |
| Administrative bodies and non-commercial undertakings                          |   | -          |

| - Exchange traded exposures          | -   | N/A  | N/A  | N/A   |
| - Private equity exposures           | -   | N/A  | N/A  | N/A   |
| - Private equity exposures           | -   | N/A  | N/A  | N/A   |
| Securitisation positions             | -   | -  | -  | -   |
| Non-credit obligation assets         | N/A   | N/A  | N/A  | N/A   |

|              |   |              |   |   |
|--------------|---|--------------|---|---|
| <b>Total</b> | - | <b>2,377</b> | - | - |
|--------------|---|--------------|---|---|

The above table includes collateral applied against exposures and does not include collateral which has been applied against loss given default or risk weights. Collateral balances within the Annual Report generally refer to securities financing transactions which are not part of the credit exposures above.

### **Forward-looking statements**

This document contains certain forward-looking statements within the meaning of Section 21E of the US Securities Exchange Act of 1934, as amended, and Section 27A of the US Securities Act of 1933, as amended, with respect to certain of the Group's plans and its current goals and expectations relating to its future financial condition and performance. Barclays cautions readers that no forward-looking statement is a guarantee of future performance and that actual results could differ materially from those contained in the forward-looking statements. These forward-looking statements can be identified by the fact that they do not relate only to historical or current facts. Forward-looking statements sometimes use words such as "may", "will", "seek", "continue", "aim", "anticipate", "target", "expect", "estimate", "intend", "plan", "goal", "believe" or other words of similar meaning. Examples of forward-looking statements include, among others, statements regarding the Group's future financial position, income growth, assets, impairment charges, business strategy, capital ratios, leverage, payment of dividends, projected levels of growth in the banking and financial markets, projected costs, estimates of capital expenditures, and plans and objectives for future operations and other statements that are not historical fact. By their nature, forward-looking statements involve risk and uncertainty because they relate to future events and circumstances, including, but not limited to, UK domestic and global economic and business conditions, the effects of continued volatility in credit markets, market related risks such as changes in interest rates and exchange rates, effects of changes in valuation of credit market exposures, changes in valuation of issued notes, the policies and actions of governmental and regulatory authorities, changes in legislation, the further development of standards and interpretations under International Financial Reporting Standards (IFRS) applicable to past, current and future periods, evolving practices with regard to the interpretation and application of standards under IFRS, progress in the integration of the Lehman Brothers North American businesses into the Group's business and the quantification of the benefits resulting from such acquisition, the outcome of pending and future litigation, the success of future acquisitions and other strategic transactions and the impact of competition - a number of which factors are beyond the Group's control. As a result, the Group's actual future results may differ materially from the plans, goals, and expectations set forth in the Group's forward-looking statements. Any forward-looking statements made herein speak only as of the date they are made. Except as required by the UK Financial Services Authority FSA, the London Stock Exchange or applicable law, Barclays expressly disclaims any obligation or undertaking to release publicly any updates or revisions to any forward-looking statements contained in this announcement to reflect any change in Barclays expectations with regard thereto or any change in events, conditions or circumstances on which any such statement is based. The reader should, however, consult any additional disclosures that Barclays has made or may make in documents it has filed or may file with the SEC.
