-

Item 7.01 Regulation FD Disclosure.

Goldrich Mining Company (the Company) is pleased to announce it has begun a diamond-core drilling program at its Chandalar gold property in Alaska, as described in its press release dated July 6, 2011. The drilling program, which began last week, will test multiple targets with 25 to 30 angle holes averaging 500 feet, with some up to 750 feet.

Drilling will explore an established northeast trend of gold mineralization more than five miles long and a half a mile wide. Gold mineralization occurs where a series of northwest striking shear zones cut a northeast structural feature (folding). Gold with strong arsenic mineralization along this corridor is hosted within the broad shears and their enclosing metamorphic stratigraphy. The mineralized meta-sediments are black graphitic phyllites and chloritic schists, within the black phyllites exists peripheral to the gold mineralization, yielding a strong, northeast trending magnetic halo more than five miles long.

A copy of the press release is attached as Exhibit 99.1 and is incorporated herein by reference.

In accordance with General Instruction B.2 of Form 8-K, the information in this report, including the exhibits attached hereto, shall not be deemed filed for purposes of Section 18 of the Securities Exchange Act of 1934, as amended (the Exchange Act), nor shall such information be deemed incorporated by reference in any filing under the Securities Act of 1933, as amended, or the Exchange Act, except as shall be expressly set forth by specific reference in such a filing.
